Sunscreen a must for kids this summer

By Sandy Parker
USA TODAY

Coating children with sunscreens — and teaching them the habit — may be up to 98 percent effective in preventing skin cancer, studies show.

"I suggest that all Caucasian children should have sunscreens introduced early in life and probably all their lives," says Alfred Lane, who teaches dermatology and pediatrics at University of Rochester Medical Center in New York.

Black children should use sunscreens if exposed two or three hours during intense sunlight. "Blacks have lower cancer risk. . . . The darker your skin, the better able it protect itself from the sun," he said.

Lane and other leading dermatologists and pediatricians met Monday in Washington, D.C., to discuss the issue.

Among their tips:

■ Apply a small amount of sunscreen to a baby's arm or leg and wait a day to determine allergies.

■ Use waterproof products with sun protection factors of 15 or more and reapply every 90 minutes.

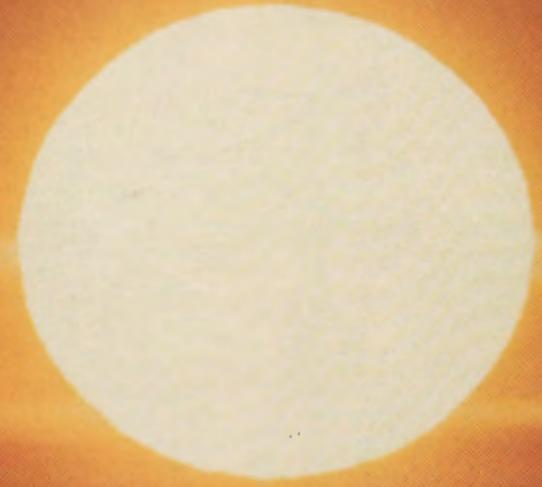

■ Limit sun exposure between the high-intensity hours, 10 a.m. to 3 p.m.

■ Dress children in loose, light-colored clothing.

WHY
YOU
SHOULD
KNOW
ABOUT

MELANOMA

WHY YOU SHOULD KNOW ABOUT MELANOMA

Like every other part of your body, your skin is a place where cancer can develop. Skin cancers are most readily cured when discovered early and treated promptly. Every year, about 450,000 Americans are newly diagnosed with skin cancer, making this the most common form of the disease. Fortunately, this is the easiest of all cancers to detect and most can be treated successfully. Skin cancer is linked to repeated exposure to the sun, and can be largely prevented with simple precautions.

Developed in cooperation with the
American Academy of Dermatology.

WHAT IS THE DIFFERENCE BETWEEN A MELANOMA AND AN ORDINARY MOLE?

A normal mole is an evenly-colored brown, tan, or black spot in the skin. It is either flat or raised. Its shape is round or oval and it has sharply defined borders (Fig. 1). Moles are generally less than 6 millimeters in diameter (about the size of a pencil eraser). A mole may be present at birth or it may appear spontaneously, usually in the first few decades of life. Sometimes several moles appear at about the same time, especially on sun-exposed areas of the skin. Once a mole has fully developed, it normally remains the same size, shape and color for many years. Most moles eventually fade away in older persons.

Almost everyone has moles, on the average of about 25. The vast majority of moles are perfectly harmless. A sudden or continuous *change* in a mole's appearance is a sign that you should see your physician. However, a melanoma is more complicated than a mole.

Here's the simple **ABCD** rule to help you remember the important signs of melanoma:

- A. ASYMMETRY.** One half does not match the other half. (Fig. 2)
- B. BORDER IRREGULARITY.** The edges are ragged, notched or blurred. (Fig. 3)
- C. COLOR.** The pigmentation is not uniform. Shades of tan, brown, and black are present. Red, white and blue may add to the mottled appearance. (Fig. 4)
- D. DIAMETER GREATER THAN 6 MILLIMETERS.** Any sudden or continuing increase in size should be of special concern. (Fig. 5)

Fig. 1

Fig. 2

Fig. 3

Fig. 4

Fig. 5

OTHER WARNING SIGNS OF MELANOMA

Change in the surface of a mole — scaliness, oozing, bleeding or the appearance of a bump or nodule (Fig. 6); spread of pigment from the border into surrounding skin; redness or a new swelling beyond the border; change in sensation . . . itchiness, tenderness or pain.

Fig. 6

HOW IS MELANOMA DIAGNOSED?

If your physician suspects that a change in your skin is a sign of melanoma, a sample of the tissue must be examined microscopically to confirm the diagnosis. This procedure is called a biopsy, and usually can be done quickly and easily in the physician's office. The biopsy sample is sent to a pathology laboratory for study, and the results will be ready in a few days.

CAN MELANOMA BE TREATED?

Yes! *In the early stages, melanoma is completely curable.* Surgery is the best way to remove early melanomas. Later stages may require more extensive treatment. For advanced melanoma, treatment must be individualized. Again, the best weapon against melanoma is early detection and prompt removal.

IS THERE ANY WAY TO PREVENT MELANOMA?

Yes! By keeping your exposure to the sun at a minimum, you can reduce your risks. This is especially true for light-complexioned people and those with a tendency to develop many and/or atypical moles. Use a 15 SPF-rated sunscreen, especially from 10 a.m. to 3 p.m. Remember to re-apply the sunscreen after swimming or sweating. Also, don't use indoor sunlamps, tanning parlors or tanning pills.

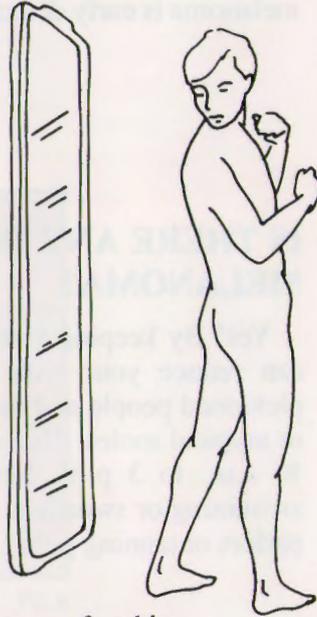

DO A MONTHLY SKIN SELF-EXAM

Get familiar with your skin and your own pattern of moles, freckles, and "beauty marks." Be alert to changes in the number or size, shape or color of pigmented areas. The best way to do this is to give yourself a skin exam (see Pg. 8). Call your physician if you find any unusual changes. And make prevention and early detection of melanoma part of your life.

YOUR SKIN SELF-EXAM

The best time to do this simple monthly exam is after a bath or shower. Use a full-length and a hand mirror so you can check any moles, blemishes or birthmarks from the top of your head to your toes, noting anything new—a change in size, shape or color, or a sore that does not heal.

1. Examine your body front and back in the mirror, then right and left sides, arms raised.
2. Bend elbows and look carefully at forearms and upper underarms *and* palms.

3. Sit, if that is more comfortable, to look at backs of the legs, feet—spaces between toes *and* soles.

4. Examine back of neck and scalp with the help of a hand mirror, part hair (or use blow dryer) to lift it and give you a close look.

If you do the exam regularly, you will know what is normal for you and can feel confident. Remember the **ABCDs** and check with your physician or clinic if you find something.

AMERICANS AND OUTDOOR RECREATIONAL ACTIVITY

o In 1985:

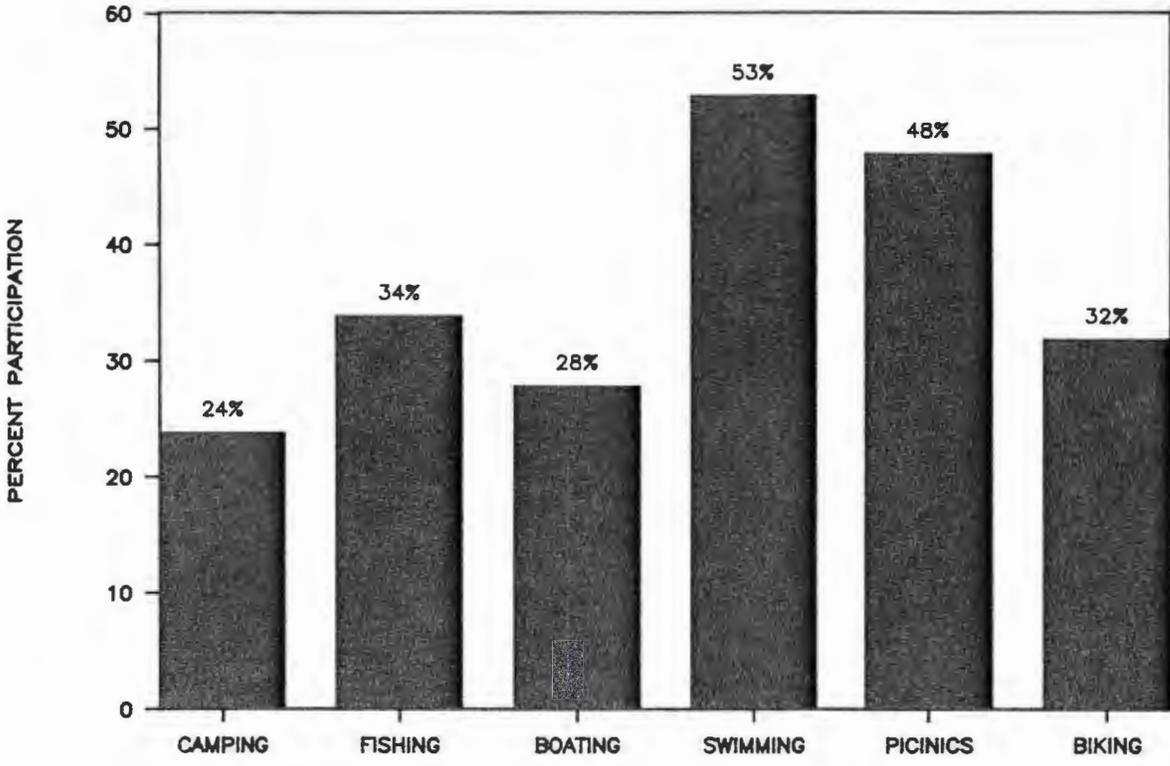

- 35 million Americans, including 71,000 youths participated in amateur softball games.
- 18,951,000 played tennis
- 17,520,000 played golf
- 13 million attended major league football games
- Approximately 47 million people attended major league baseball games.
- 11.4 million new bicycles were purchased.

- In 41% of American households at least one member tended a flower garden, and in 64% at least one person was routinely engaged in lawn care.
- o In 1985, 5.2 million American families had outdoor swimming pools or spas. According to estimates by the National Spa and Pool Foundation, 19 million Americans live in a dwelling with either a pool or a spa.
- o Over the long term such participation is expected to increase, due, in part, to the maturation of the exercise conscious baby boom, an increase in the number of two income households, and the migration of the population to the south and the west which have a longer season in which to enjoy outdoor activity.
- o Although the American suncare market is already \$350 million per year, maximum protection sunscreen accounts for only 28% of the market.

American attitudes towards the sun

- o According to a recent study for the American Academy of dermatologists, 96% of the American public is aware that sun exposure can cause skin cancer and lead to prematurely aged skin. However:
 - One in three adults intentionally work on a tan.
 - One in four adults take no precaution.
 - 75% of teens think a tan looks healthy.
 - 66% of adults agree.
 - Adult men and women pursue a tan with the same frequency, but 66% of teenage girls as compared with 33% of teenage boys. One in three teens take no precautions against the sun.

PARTICIPATION IN OUTDOOR RECREATION ACTIVITIES

women's makeup (foundation) with sunscreen claims.
