DEFENSE PROCUREMENT DIVISION DEFENSE PROCUREMENT AND SERVICE COORDINATION MISSION

2224 R STREET, N.W. WASHINGTON, D.C. 20008

TELEPHONE: (202) 234-9334

CABLE ADDRESS: "SINOPROSE"
TELEX: 89689 CCNAADPD WSH

February 15, 1985

Mr. David Dean
Chairman of the Board
and Managing Director
American Institute in Taiwan
1700 North Moore St., 17th Floor
Arlington, Va. 22209

Dear Mr. Dean:

The United States is fully aware that my country has embarked on major undertaking to develop and to produce the Light Weight Defense Fighter (LWDF). This project will enhance significantly the selfsufficiency of my country in maintaining a credible defense posture. With encouragement from the United States, my country has made major resource commitments to the LWDF program. However, without continuing cooperation and technical assistance from the United States the LWDF program can not proceed in an orderly and efficient manner.

The LWDF program is now at a point where lack of export licenses from the United States for several key items has frustrated any further progress. Specifically, we have been planning to receive export license approval from the United States by no later than February 1, 1985 for eight first priority, critical long lead time items. The major subsystems for which we need export licenses are as attached.

Your assistance in expediting the approval of the export licenses for the subsystems is hereby requested. The United States is renowned throughout the world for its expertise in program management. We fully appreciate, therefore, the importance of timely U.S. responses to our requirements. Without them the LWDF program, the

the LWDF program, the.....

largest and most sensitive defense project we have ever undertaken, simply will not fulfill its objective.

Meanwhile, with no export licenses and no progress, we are wasting \$250,000/per day on un-productive man power costs along.

Sincerely,

KUN, YUN
Director

DEPARTMENT OF THE AIR FORCE

WASHINGTON 20330

OFFICE OF THE ASSISTANT SECRETARY

MEMORANDUM FOR ASSISTANT SECRETARY OF DEFENSE (INTERNATIONAL SECURITY AFFAIRS)

SUBJECT: Taiwan's Lightweight Defensive Fighter (LWDF) (Your Memo, Jan 7, 1985) (U) - INFORMATION MEMORANDUM

- The results of our initial assessment of Taiwan's LWDF proposal are enclosed for your review (Atch 1-2). Please note that the short suspense precluded a USAF review of the entire LWDF requirements list. Instead, a quick comparison of the Golden Dragon-53 Westinghouse radar and LWDF concept relative to USAF fighter configurations was accomplished. A complete operational assessment could be completed within four months. The comparison draws heavily from US contractor-furnished projected performance data on the engines and radar, since this data was not provided by Taiwan. As such, the Air Force cannot validate this data or the conclusions drawn from them.
- (8) The USAF strongly supports the envisaged concept of Taiwan's indigenous fighter aircraft development through US industry license technical assistance agreements. However, continued USAF support to this initiative is contingent upon receipt of the following:
- (U) Formal OSD program direction outlining specific USAF responsibilities and the established operational limitations upon which the aircraft configuration baseline is to be set.
- (8) A Foreign Military Sales administrative case which provides Taiwan funds for USAF manpower, travel and management services attendant with the LWDF initiative.
- (S) Unless otherwise prescribed, we envision the USAF's role in the LWDF program as one of oversight and interface with the US prime integration_contractor of Taiwan's selection. The Office of the Special Assistant for International Cooperative R&D, HQ USAF/RD-I will serve as the Air Staff focal point and facilitate direction and guidance to subordinate commands needed to properly execute the program. Please advise if we can be of further assistance in this matter.

LANCE HOLLING

EXECUTIVE SUMMARY (U)

- 1. (SMF) TASKING: Conduct a quick look comparison of the Westinghouse GD-53 radar versus the APG-63, -66, and -67 radars and LWDF aircraft performance versus F-16A and F-20.
- 2. (U) DATA SOURCES: To conduct this study, data was obtained from the following sources:
- a. (U) Partial engine performance data was obtained from Garrett by telephone request.
- b. (U) F-5, F-16A, F-20 and F-16/J79 performance was generated using existing in-house data.
- c. (U) Aircraft weights were estimated using configuration data from a variety of classified briefing charts, messages, etc.
- d. (U) Aerodynamic data was generated for a generic aircraft representing an F-16 type state-of-the-art fighter.
- e. (U) GD-53 radar performance was estimated based on Westinghouse Proposal (Volume I) for GD-53 Radar System, dated March 1984.
- f. (U) APG-63, -66, and -67 radar performance data was available inhouse.
- 3. (U) AIRCRAFT CONFIGURATION: The LWDF aircraft evaluated was defined as follows:
 - a. (U) Configuration as described in classified briefing charts.
- b. (U) Two (2) Garrett TFE 1042-70 engines each rated at 5000 lb thrust, 8350 lb augmented.
 - c. (U) Estimated aircraft gross weights (lbs)

 Empty 12,860

 Basic Mission T.O. weight 19,830

 Max 27,200
 - d. (U) Armament 2 AIM-7s, 2 AIM-9s, 7 MK-82s, M61 Gun (500 rounds).
- 4. (U) MISSION PROFILES: The mission profiles used were extracted from in-country briefing material.
- 5. (U) FINDINGS:
- a. (C) RADAR The performance of the GD-53 radar is equivalent to the F-20's APG-67 and is superior to the F-5's APG-159 which does not have a

COMPLEHMAL NO FORN DISSEM

look-down capability. With an increase in antenna size the GD-53 could provide performance similar to the F-16's APG-66. From a technical standpoint, the proposed GD-53 development program is considered low risk.

b. (C) PERFORMANCE - For the mission profiles provided, the performance of the aircraft falls approximately midway between the F-5 and the F-20/F-16.

1. (W) DESCRIPTION:

- a. (U) The GD-53 Radar System as defined in the Westinghouse Defense Electronics Center proposal has been reviewed. The GD-53 radar is an outgrowth or derivative of the USAF AN/APG-66 radar utilized in the F-16A aircraft. The GD-53 utilizes a low sidelobe, two channel monopulse, planar array antenna with IFF dipoles. The antenna is 12.36" high by 19.82" wide; and has a gain of 28.5 db. The GD-53 transmitter is a 21.5 KW peak power traveling wave tube (TWT), air cooled transmitter. The transmitter produces higher power than the APG-66 transmitter. The low power radio frequency (LPRF) unit in the GD-53 is similar to the APG-66, but adds a second receiver channel for two channel monopulse operation. The signal and data processing in the GD-53 is provided by the Radar Digital Assembly (RDA). The RDA uses advanced digital technology, such as configurable gate arrays, large scale integration devices, and flat pack packaging. The RDA uses MIL-STD-1750A Instruction Set Architecture Computers and is programmed in MIL-STD-1589 Jovial Higher Order Language.
- b. (d) The modes available in the iGD-53 are shown in Figure 1-along in a continuous with the modes of other US radars and the research
- 2. (e) <u>FINDINGS</u>: The proposed radar is an X-band low/medium Pulse Repetition.

 Frequency pulse doppler radar, which will provide good look-down detection

 of airborne targets in the presence of ground clutter. The look-down

 detection performance of this radar is depicted in Figure 2 and is compared

 to the detection capability of other US radars. The GD-53 performance is the less than the APG-66 radar because of a smaller antenna. With equal antenna

NO FORM DISSEM

DUTTE LIVIAL

NO FORM DISSEM

sizes, the GD-53 would provide greater detection range than the APG-66. The comparisons of antenna gains and average output powers are shown in Figure 3.

3. (C) CONCLUSIONS: The GD-53 is a state-of-the-art pulse doppler radar utilizing the latest electronic devices and digital design. The GD-53 has improved air-to-ground modes over the APG-66 radar; such as, a higher doppler beam sharpening ratio (16:1 vs 8:1) and Ground Moving Target. Indication (GMTI). The radar provides added capabilities over the F-5/APG-159 radar; such as look-down air-to-air detection capability and provides approximately 40% more look-up detection range than the APG-159. As shown in Figure 1, the GD-53 provides many more air-to-ground modes than the APG-159. The GD-53 is essentially equivalent to the AN/APQ-67 radar which was developed for the F-20 aircraft.

Personal Incomment

COMMENTS ON PERFORMANCE ESTIMATES

- 1. Mission profiles developed by the Air Force are normally task oriented to maximize performance with the least amount of fuel. The LWDF Mission Profiles are unique in that they require max use of afterburner for take-off and climb due to the short radius of action requirement and five minutes of afterburner for combat at midpoint. Consequently, the use of these same profiles for the comparative aircraft results in a large expenditure of fuel due to their bigger engines (e.g., for the F-16A, over 50% of the internal fuel is used for the 5 minutes combat time in Mission I). The result is that the performance numbers shown are significantly reduced from the capabilities normally associated with these aircraft.
- 2. The conditions specified for the performance parameters were selected on the basis of the estimated engine data handcarried to ASD by Garrett. Due to the time constraint, no attempt was made to determine the validity of this data.
- 3. For the Radius of Action parameter, only two AIM-9s were used for the comparative aircraft, since they are not currently authorized the carriage of AIM-7s.
- 4. PS (Excess Specific Power) is defined as a value representing the aircraft's ability to accelerate and/or climb at a specific point in time along the velocity axis.
- 5. Comparative aircraft data used were representative of current production aircraft configuration and existing flight manual limitations. No attempt was made to optimize the comparative aircraft configuration for the three basic missions.
- 6. Estimates for the LWDF were based on the in-country briefing data package for weights, wing area and configuration and aerodynamic drag trends based on F-16 drag data.

Information Memorandum

To: P - Mr. Araecost

Prox: EAP - Paul Wolfowitz

Subject: EAP views on the Taiwan aircraft situation

Reference: August Memorandum on Taiwan's Indigenous

Fighter Aircraft (Attached)

Air defense has long been recognized by the U.S. as well as Taiwan as a key aspect of Taiwan's deterrent capability, and for ten years a follow-on aircraft to Taiwan's co-produced F-5E aircraft has been high on the list of Taiwan's arms requests from the U.S. Taiwan's dire predictions about improved PRC capabilities stemming from introduction of the P-8 are not considered valid by the U.S., which concluded in 1982 that a new interceptor aircraft was not needed by Taiwan "at this time. It may be more difficult in the future to make such Engumentation convincing, as the U.S. and others assist the PRC in improving its aircraft performance and weaponry. Taiwan has also argued that reductions in its aircraft numbers and capabilities point to a need for additional aircraft fairly Taiwan estimates that, by 1989, it will lose through attrition 43% of its current aircraft inventory. Even before that time, reduced operational readiness of the aging aircraft will make the numbers an exaggerated indicator of capability. Given the increasing problem over time and the long lead time revised for most solutions, we can expect Taiwan to continue to emphasize its air defense problems and to increase pressures for favorable decisions. The following is the status of the various aspects of Taiwan's aircraft situation.

1. F-5E. Taiwan currently has 238 F-5E's and, under a co-production arrangement with Northrop, will add an additional 32 by July 1986. It is possible to extend again the co-production of F-5E's, and Taiwan has tentatively spoken to Northrop about doing so.

Although many countries are reluctant to have any arms relationship with Taiwan, even with the U.S. as intermediary, it is likely that, for some time in the future, Taiwan will be able to purchase F-5E's from some countries which now have them. Additional F-5E's would help solve the numbers problem set forth in attachment A.

CONFIDENTIAL DECL: OADR

.4(d)

-CONFIDENTIAL

2. F-104G. In 1982 the U.S. facilitated Taiwan's purchase from Germany of 66 F-104G's located at Lake AFB. Arizona.

recrutly had two accidents with its F-104G's and is concerned about age and consequent maintenance difficulties of these aircraft; however it has arranged to buy an additional quantity from Japan. Taiwan has thus far refused to consider upgrades to the F-104 believing them not to be cost effective given the age of the F-104 airframe.

3. F-20. Taiwan continues to request the F-20

Taiwan is convinced that the F-20 is a good airplane, and they would like to have it in their inventory even if they also produce an indigenous interceptor since they believe something will be required to fill the gap left as F-100's, F-104's, and F-5A's are phased out and substantial LDF production is not yet realized. Northrop has received no orders for the F-20 and one cannot be sure that it will ever be connercially produced. If Northrop does not receive substantial orders within the next two years, it is likely that the F-20 will be abandoned. We see no Taiwan need now for the F-20, but we cannot be sure that it will be available later at a time when we might want to provide it to Taiwan.

the consequence of the consequen

5. F-5E upgrades. Improvements have been regularly incorporated into the F-5 over the years. Northrop and other yeadors have recently come up with an avionics package which would improve F-5E performance. These upgrades would not be notifiable and could be considered merely "serial modifications" for equipment already in the F-5E; they would therefore not be visible.

- 6. Indigenous Lightweight Defensive Fighter (LDF). Taiwan has been working more seriously on the indigenous LDF than we had thought. We had earlier approved a co-design/co-production effort for the Garrett TFE-1042 engine. Taiwan has made a significant investment in this new engine as well as in facilities for the design and production of the LDF. Taiwan's schedule is as follows:
- -- 31 August 1984, complete conceptual design phase
- -- August 1984 to March 1985 preliminary aircraft design and development of a coherent program plan
- -- March 1985 to March 1987, begin detailed design and manufacturing operations
- -- March 1987 to March 1989, continue testing of 2nd and 3rd prototypes
- -- 1990, initiation of serial production

U.S. delay in approving the licenses for avionics systems and for systems integration assistance by General Dynamics has set Taiwan's program back six months already; Taiwan will not be able to make up for this delay in what is essentially a very optimistic schedule.

In December 1983, Under Secretary Eagleburger approved the first stage of U.S. licensing for General Dynamics (GD) assistance to Taiwan. That approval, limited Taiwan to developing an aircraft at the F-5E level with growth potential. You subsequently approved a new GD request to do a critique of Taiwan's own designs, and Taiwan and GD were both

step, a critique of the model which Taivan has tested in its wind tunnel. GD completed the critique in December and in January provided us with a briefing of the sircraft design and its capabilities. The next step would require approval of Evionics systems and continued GD assistance in systems integration. We shall now have to make a decision on specific avionics systems in order for Taivan to continue with detail design work.

7. Delaying decisions on both the F-20 and the indigenous LDF. A more advanced aircraft such as the F-20 and potentially the indigenous LDF would supply what Taiwan's leadership considers a key need in the 1990's.
